

Project 1 email findings:

Samsung email app: in this app the animations and images are fully loaded. The stacked column feature wasn't used since the email could fit the designated screen space. The hover feature worked on all buttons. Some of the colors do change based on what viewing mode you are using. I use dark mode so the grey background gets darker and the slide buttons background color changes to black. The white text I had put in the red/burgundy sections turned to black when viewing in light mode. The buttons on the bottom also look different depending on which mode you are using. In light mode the buttons look how I made them, while in dark mode the border and inside background colors of the buttons are different shades. For some reason the address on the very bottom of the email also has a box like my buttons when I didn't add that, it does not appear like that when looking at the website. Since the address is real, it turned it into a hyperlink to google maps.

Google Mail app: In this one the stack column feature is utilized. Again the colors change depending on which viewing mode you are using. The main issue in google mail is that none of the images work so the animations also don't work. In this app the buttons don't do the slight lift up animation when hovering over them. A box is also added for some reason around the address. Like samsung's app the address is turned into a hyperlink.

Yahoo Mail App: Very similar to Samsung's email app. This one also utilizes the stack column feature. All the images work but the animations don't work. The hover feature works but doesn't do the slight lift button animation. Unlike Google mail and Samsung email, this one doesn't add a box around the address at the bottom of the email. It also doesn't turn the address into a hyperlink. Like the others though, the colors do change depending on your viewing mode.
